1.Use Instruction

1.1 Safety Instruction

- ♦ The product is not suitable for the ones who are less than eighteen or who do not have full capacity for civil conduct.
- ♦ The product have bigger fuselage size, high speed rotary and strong flight dynamics. At runtime have a certain dangerousness . Not in accordance with the requirement operation and usage will cause to potential danger and hurt.
- ♦ When using this product, please keep away from airport, railroad, high speed road, high buildings ,electric wire and other dangerous environments.
- ♦ When using this product, please keep away from mobile phone base stations, high power transmitting equipment, and other high electromagnetic interference environments.
- ♦ When using this product, please keep away from army and kinds of manned craft flight area.
- ♦ Don't use this product in rain, thunder, sandstorm, fog snow ,high wind ,and low temperature and other bad environments.
- ♦ When flying in more than three kilometers. Environmental factors can lead to flight performance degradation, please care of using it.
- ♦ When operating this product fly in low sky .Please always keep UAV and people & animals in a safe distance of ten meters
- ♦ When using this product in desert area, please keep UAV within the range of operator's eyes
- ♦ Don't hover or fly over the crowd, Don't be delight in scaring others.

- ♦ When it is close to the crowd ,please land this UAV as soon as possible and guide people to keep and avoid potential accident.
- ♦ Don't operate it in the area of children playing.
- ♦ If not in the extreme necessary condition, please do not power off when flying in the air.
- ♦ You can not fly it you are in drinking , tied, drugs, physical ,discomfort, etc. .
- ♦ Please inspect it before using very time, including but not limited to parts of fastness, organism and propeller of cracks, and abrasion ,battery ,the effectiveness of light. When error happens, please stop using immediately and replace the corresponding parts.
- ♦ Abnormal working state of the UAV maybe happen accidentally, don't open the propellers and forcibly fly with wrong.
- ♦ Do not try to prevent the moving parts while working.

1.2 Pesticide Usage

- ♦ All pesticides are poisonous. Please be careful and work strictly according to the safety instructions of pesticides.
- ♦ When dispensing, please use clear water. If not, will cause jams mesh of impurities. If it is blocked, please clear it before reuse
- ♦ When dispensing , please note that liquid sparks and the pesticide residue in fuselage will be harmful to human body.
- ♦ When dispensing, please pay more attention and use protective tools, and do not let body directly touch with the pesticides; After pesticide spraying, please clear your skin, copter and remote control.

- ◆ When using pesticide, there will be interaction between different pesticides , user should clear cartridge or keep a certain interval time。
- ◆ Spraying shall be carried out in windless sunny day, don't spray under high temperature at noon. While breezing, the operator should be standing above the wind and spraying; do not work when wind is four.
- ◆ When spaying ,if you feel uncomfortable ,headache or dizzy, please leave the site at once and rest. If once severe symptoms occur, immediately be sent to hospital.
- ◆ Pesticide effect and the solution concentration, spray rate ,copter high from crops ,wind direction, wind speed and so on are close related. When using pesticide should consider the above factors, to achieve the best effect. Please make sure that do not damage the human beings and animals and surroundings during the process of sprayings.
- ◆ When using pesticide , do not pollute river and drinking water

1.3 Inspection

- ◆ Before flying, ensure the battery is enough
- ◆ Ensure all the parts are installed firmly, and all the screws are tight as required.
- ◆ Ensure all the wires are correctly linked.
- ◆ Ensure all parts goes well. If it is broken or aging, please replace timely.
- ◆ Before flying, carefully check the propellers installation direction 、 rotation direction, control and others.
- ◆ Ensure all the propellers are fine, no any scratch and tightly installed.
- ◆ Ensure the sprayer is fluent without any clogging and work normally.

1.4 Environment

- ♦ While flying, please ensure the drone away from the crowds, dangerous goods, high buildings, high-voltage wires and others. Please fly the drone in a dedicated space.
- ♦ Please ensure the drone fly within the operator's eyesight.
- ♦ The drone working temperature is between 0°C-40°C.
- ♦ Ensure the drone fly within the permit of local law and regulations.
- ♦ To fly the drone safely as required, please fly it within in the height of 50 meters. If it has local flying height limit within 50meters, please make sure obey the related regulations.

1.5 Operation

- ♦ Please ensure the multi-rotor drone flying height is within 8 meters, except the special requirements.
- ♦ Before remote control calibration、hardware update, parameter setup, please remove the propellers and avoid the potential moving suddenly.
- ♦ Remove the battery if it does not fly, to avoid flying it when touching the remote control once.
- ♦ Please remove the batteries once landing. Do not move the drone when it is in power.
- ♦ Do not touch the joy stick mistakenly, and prevent start the drone.
- ♦ When it is powered, please stand in the safe distance of above 10 meters.
- ♦ Ensure the propellers completely stop and power off.
- ♦ Please switch it to the manual operation mode when errors happen. When the manual operation mode does not work, please press the emergency bottom. Please keep

away from the crowd.

- ♦ When the battery is damaged, please ensure it is stored in the disposal area and avoid spontaneous combustion. In order to protect environment, please don't throw batteries randomly. And consult the maker about the proper disposal method.
- ♦ During the flight, don't fly overload and do not cause any potential dangers.
- ♦ When low battery is warning, please return as soon as possible.
- ♦ Ensure that the remote control and battery is enough, to ensure that firmware has been updated to the latest version.
- ♦ Ensure flying sites outside of the restricted areas and is proper for flight . .
- ♦ Please make sure do not fly or operate the drone when you are drunk or with medicine limitation.
- ♦ Be familiar with the remote control operation & each flight mode, and ensure you know how to operate the control condition.
- ♦ User shall know and obey all the law and regulations in flying location.

1.6 Compass Calibration Requirements

- ♦ Compass has to be calibrated before using the first time. If else, it cannot work and will affect flying safety. Calibration tips:
- ♦ Please do not calibrate it in the place close to the high-magnetic field or big metal materials, such as high-voltage, magnet, parking lot, concrete iron building, etc.
- ♦ When calibrating, please do not bring the magnetic materials, such keys and cellphone.
- ♦ If it is calibrated indoor, please do not re-calibrate it outdoor. It prevents that the two magnet differences cause the potential flying data errors.

- ♦ Magnetic field location is different, please make sure re-calibrate when it changes to the place far away from the previous one.

2. Product Introduction

M8A20A1, the multi-rotor UAV, is the most economic integrated solution for all the agriculture spraying services, the product series payload is up to 20kg. This UAV uses carbon fiber material, the saving weight could be used to payload. The big power brushless motor guarantees the sensitiveness and flexibility. The Lipo batteries guarantee the power supply and easy to repair and maintain. Various spraying tests prove the best performances of this UAV for many years.

2.1 Flying Parameters

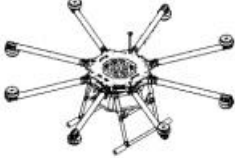

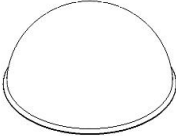

Copter weight (without battery)	18 KG	Max pitch angle	≤35°
Standard take off weight	46 KG	Best working speed	4-6m/s
Max effective take off weight	48 KG	Max working speed	10m/s
Max thrust weight ratio	2.43(take off weight 46Kg)	Working time	10-15min /sortie
Dynamic battery	16000/17000mAh *4pcs	Max ascending speed	5m/s
Max power consumption	18400W	Max descending speed	3m/s
Hovering power consumption	5400W	Max flying speed	15m/s
Hovering time	empty≥25min full≥6min	Recommended working environment temperature	10-35C°
Hovering accuracy	horizontal±1.5m vertical±0.5m	Max wind resistance	12m/s
Working height	2-4m	Max flying altitude	3500m
Max rotation angle	360°	Best reserving temperature	10-25C°

2.2 Copter Parameters

Frame	Frame	Diagonal Wheelbase	1630mm
		Arm Length	632mm
		Unfolded Height	600mm(top shield 200mm not included)
		Folded Height	710mm(top shield 200mm not included)
		Folded Width	570mm
		sprayer supporter length	3180mm
		Sprayer Distance	500-550mm(adjustable)
dynamic system	Motor	Motor Model	TTA8017-2
		Stator Size	75mm
		KV	120KV
		Max Thrust	14KG
		Max Power	2300W
		Weight	640g
	ESC	Max Continuous Working Current	80A
		Max Peek Current(3s)	120A

		Max Allowed Voltage	14S LiPo
		Working Voltage	12S (44-50.4v)
		Working Pulse Width	1000-2000us
		Compatible Signal Frequency	50-400Hz
		Drive PWM frequency	400Hz
	Propellers	Material	Carbon fiber
		Diameter /Screw pitch	3080(length 760mm)
		Weight	110g
	Battery	Capacity	16000mAh/17000mAh
spraying system	Water Tank	Payload	20L
	Sprayer	Model No.	pressure type(hollow cone)
		Quantity	6 pcs
		Sprayer Diameter	0.67mm
		Spraying Speed	4--6m/s
		Spraying Volume	1.8--2.2L/min
		Spraying Width	5--8m(up to height)
		Spraying Droplet Diameter	80--200μm(adjustable)
Remote controller	Remote controller	Type	R3
		Working frequency	2.4Ghz
		Signal effective distance(without interference and block)	800m
		Battery capacity	3.7V,3000mAh
		Charging type	direct
		Working environment temperature	0-40C°
		Reserving environment temperature	10-25C°
		Best charging environment temperature	10-25C°

2.3 Packing List

Name		QTY	Image
Fuselage		1pcs	
Spraying rod assembly		2 pcs	
Dome		1 pcs	
Propeller		4 pair	
T8FG remote controller		1 pcs	
M8A20A manual		1 pcs	
A4 adhesive sticker print paper		1 pcs	
Spare part	Tools box	1pcs	
	TTA spanner	1 pcs	
	LiPo battery charger	1 pcs	
	Electric indicator quantity	1 pcs	

	spare screw	M3*8 cylinder head 5 pcs M3*8 half round head 5 pcs M4*60 cylinder 2 pcs M4*65 positioning bolt 2 pcs	
	aviation box	optional	
	16000mAH/17000mAH battery	optional	
	Dual channel 6s charger	optional	
	Four channel 6S	optional	

3.Preparation Before Take Off

It's very important to the steps of before take off, please check carefully and ensure the copter qualified before take off.

3.1 Device Installation

Parts and lines have been installed well before copter sending out of the factory, please do not change any position of part and line and follow the following steps is enough to work.

3.1.1 GPS Antenna Installation

Step 1: erect GPS supporter, be careful that GPS supporter is vertical to the horizontal direction.

Step 2: tighten the nut on the bottom.

Figure 3-1 GPS installation effect picture

3.1.2 Arm Installation

Use a M4*65 bolt to connect arm and frame and then tighten the bolt and operate the spanner. The other arms are same step.

Figure 3-2 arm installation

3.1.3 Propeller installation

Step 1: just the propeller type, CCW or CW.

Figure 3-3 propeller type

Step 2: propeller installation, propeller first, then gasket, tighten 2 pieces of M3*14

bolt(M1,M3,M5,M7 is CCW,and M2,M4,M6,M8 is CW).

Figure 3-4 propeller installation effective figure

3.1.4 Sprayer Supporter Installation

Step 1: connect the sprayer and its connector,see figure3-5.

Step 2: pin the diagonal member and pin it through.

Figure 3-5 Sprayer supporter connection effect picture

Step 3: connect pipe(5mm*8mm) between pump outlet and sprayer,and the other sprayer.

Pressing the connector when loosening the pipe.

Figure 3-6 pipe connection in sprayer supporter

Figure 3-7 pipe connection in pump outlet

Step 4: repeat step 1 to step 3 for the other sprayer supporter.

4. Charger Instruction

4.1 Product Application

LiPo 6s balance charging

4.2 Product Features

1. balance charging
2. quick charging
3. input and output reverse polarity protection
4. Low static power

4.3 Main Technical Parameters and Application Demand

1. Input voltage: AC 220V
2. Max charging current: CH1:20.0A;CH2:20.0A
3. Max charging power: CH1:500W;CH2:500W
4. Average output voltage: CH1:25.2V;CH2:25.2V
5. Max output voltage: 27.0V
6. Max balance current: 400mA
7. Max static power: 2400mW
8. Display mode: LED display
9. Support battery cell number: 6S
10. Charger working temperature: 0~40°C

4.4 Interface Indicator

Dual channel6S-20A charger

Charging status	Charging indicator		status indicator				Note
	green	red	LED 1	LED 2	LED 3	LED 4	
Idle	●	○	○	○	○	○	
charging	○	●	Note 2				
full	●	○	●	●	●	●	charging status:good,balance well
			●	●	●	●	charging status:common,balance commonly
			●	●	●	●	charging status:poor,balance poor
abnormal	○	●	●	○	○	○	charging module abnormal
			○	●	○	○	balance port connection abnormal
			●	●	○	○	input voltage abnormal
			○	○	●	○	output voltage abnormal,check output connection with battery
			●	○	●	○	single cell high voltage alarm
			○	●	●	○	battery inspection fail,check balance port and output port
			●	●	●	○	no charging current,check output connection

Note1: ● → ○ → OFF → flash

Note2: ● → ○ → ● :LED1-LED4 flash in turn circularly,means charging in real time

Fast cycle speed:big electric current change

Slow cycle speed:charging near full

4.5 Function and Operation Instruction

1.Connect with power,leave switch at OFF position,charging channel outside is close,charging indicator is OFF.

2. Connect with power,leave switch on external power,external power supply open,charging indicator is green,charging channel is OFF.

3. Connect with power,press start button for 2s,charging channel is open,charging indicator means current status,charging status is red ON.

4.Press start button during charging process and exit charging mode;press start button when abnormal which means exit abnormal status.

5. It is suggested to charge for a while if not balanced well, which can prolong the lifetime of the battery.

4.6 Attention

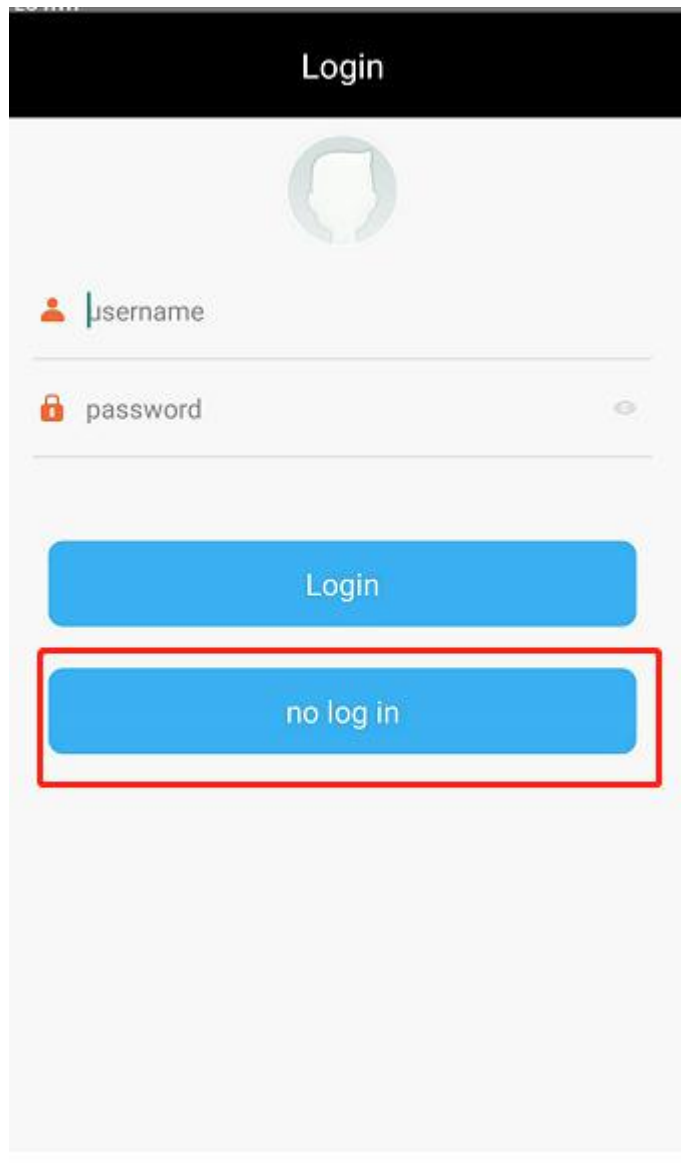

1.Over low or high charger input voltage may lead to abnormal status or damage.

2. Please observe the instruction strictly.

5. App Setting of Copter

Figure 5-1

Please choose no log in.

5.1 Software Configuration

1. Please install the GCS software.
2. After GCS installation, the label will be appeared as figure 5-1.

TTA-M6E-1 support Android 4.0 or above

3. Open GCS, enter into the start page.
4. Enter into the main page, see figure 5-2.

5.2 Parameters adjustment

Type 1: Connection by OTG cable

- Sensitivity should not be changed by common user, the unnecessary loss should be taken by user for authorized changing.

- Remote controller could not unlock before parameters adjustment.
- Exit could only be done when all of the parameters adjustment should be done and confirmed. Copter could only fly by restarting after parameters adjustment.

Parameters could be adjusted when copter connected, the steps are as followings:

- 1) Open the OTG function from cellphone SETTINGS---SYSTEM---OTG (the default is Off thus it should be opened every time), see figure 5-2-1.

Figure 5-2-1

Connect cellphone with Micro USB port of remote controller. The connection method should be USB, connection label  will be green after connected, see figure 5-3

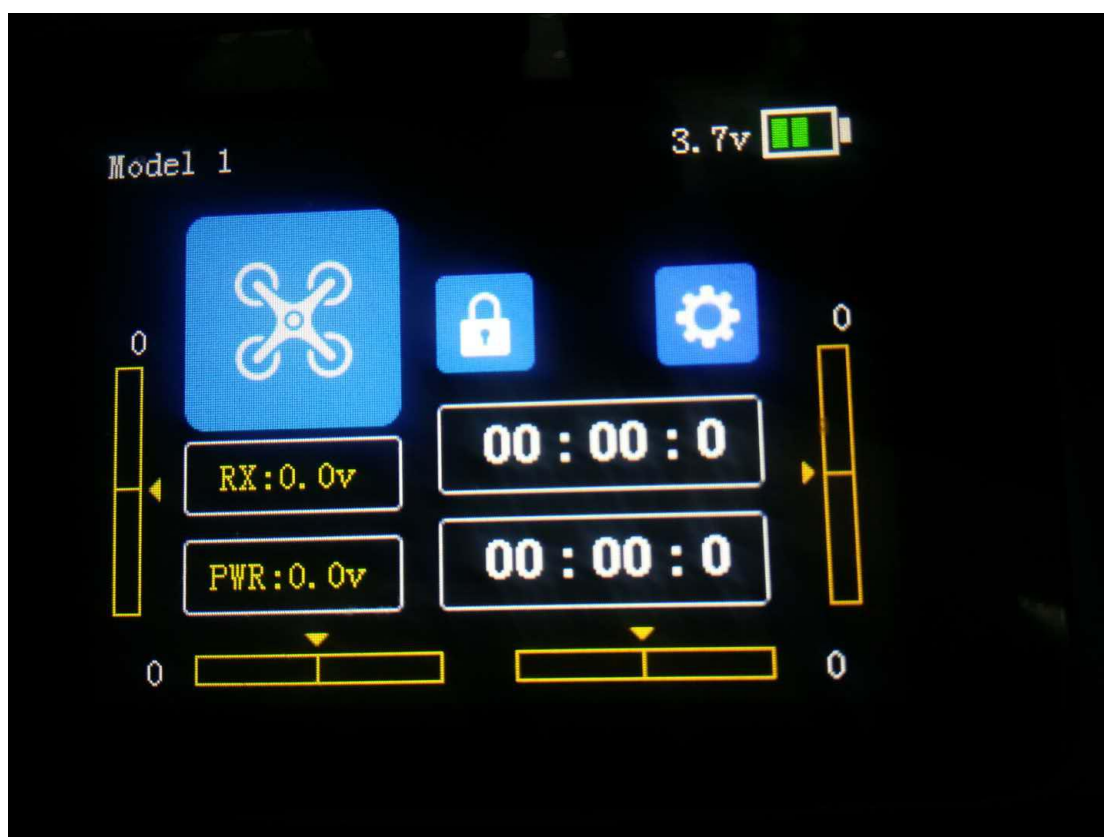

Remote controller should be selected to A-USB, see the following picture:

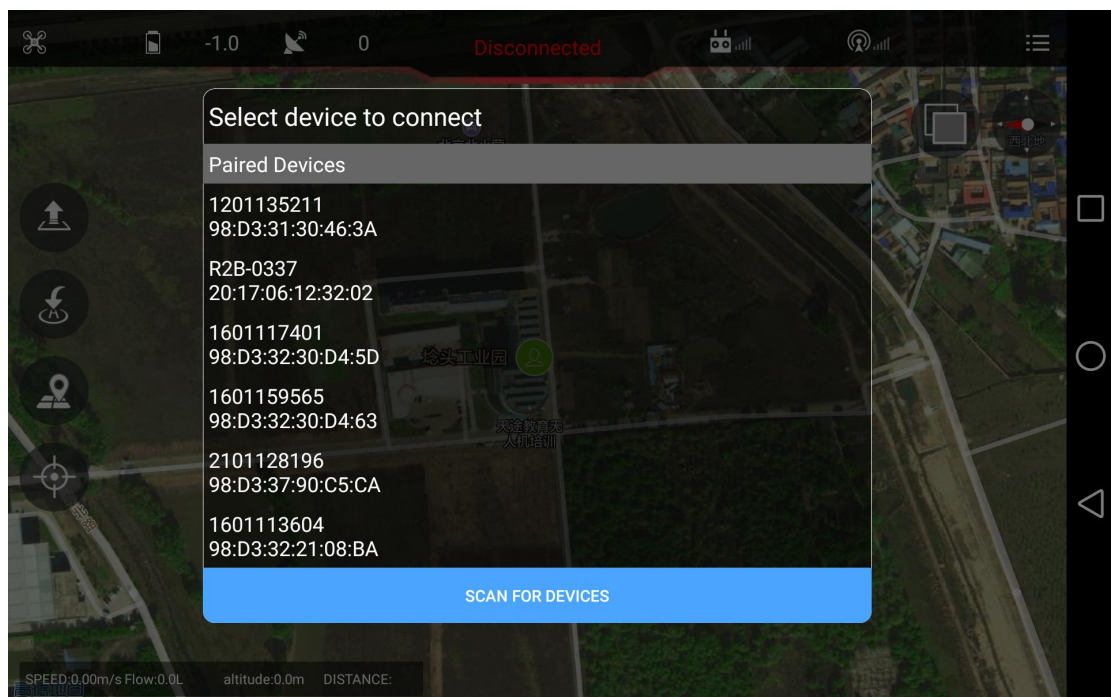

Type 2: Connection by Bluetooth connection:

Open the bluetooth function in cellphone,

Bluetooth password:1234

After connection,app will be as followings,see figure 5-4

5-4

Click label  at up right corner to enter into parameters adjustment.

5.2.1 Remote controller calibration

Remote controller calibration:click the button *READ* to get the data,see the following figure

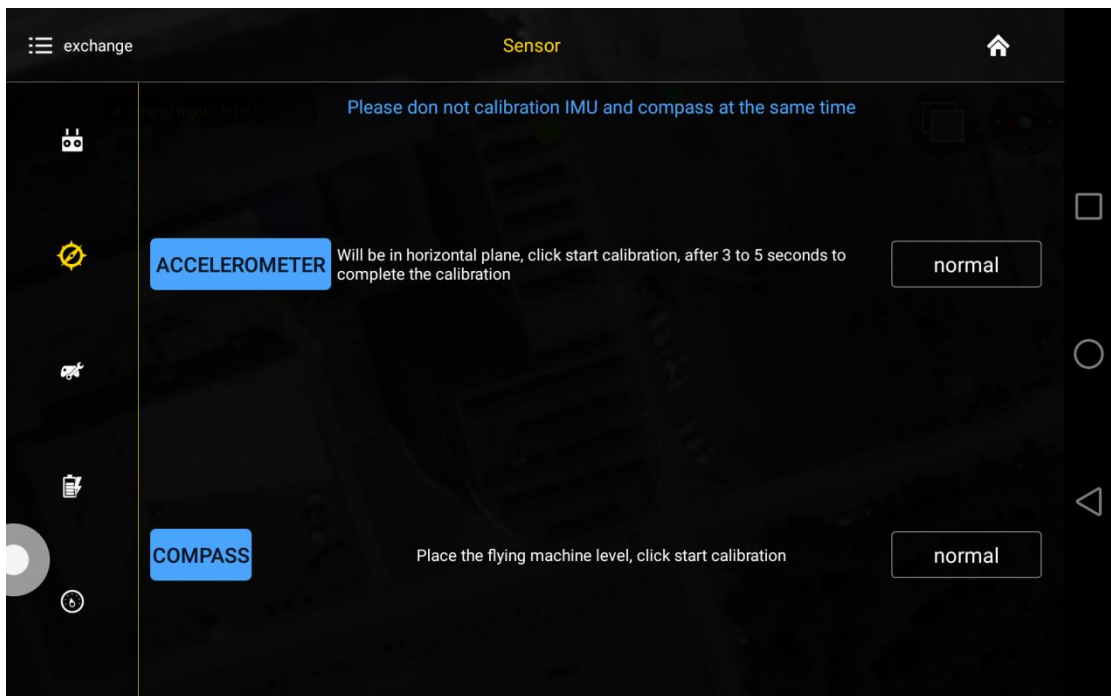

1) Start to calibrate: connect copter with GCS, click *RC CHANNEL*, move the stick to maximum and minimum position 4 to 5 times.

2) Stop calibration: click **Finish** after calibration. Then channel status could be checked.

3) Normal or reverse setting of remote controller is set to check whether it's right or wrong.

5.2.2 IMU calibration

Leave the copter in a horizontal position, click the button *ACCELEROMETER*, LED will flash in red, green, yellow alternately, LED *green* means successful calibration, data will be stored by restart.

5.2.3 Compass calibration

Calibration order

Two kinds of method of compass calibration:

- 1) Click the button *COMPASS* to enter into calibration status.
- 2) Switch switch SA back and forth more than 4 times to enter into calibration status.

Calibration Step

- 1) Confirm GCS communication well, compass installation correct and copter outside.
- 2) Clicking calibration, yellow LED of copter is on, hold and keep copter rotating clockwise and slowly, leave copter head to the ground when green led is on, rotate copter clockwise and slowly till LED flash in red, green and yellow alternately.

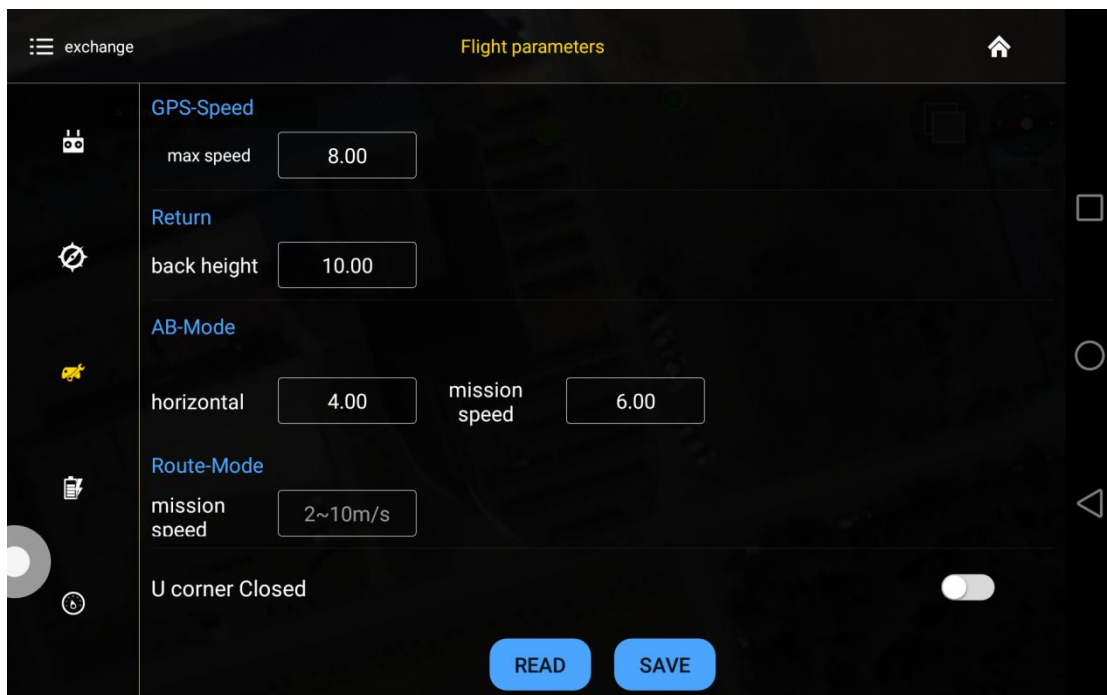

- 3) After vertical calibration, calibration mode will be exited automatically and LED will flash normally if successful, LED will keep red for 3 seconds if fails and recalibration should be done.
- 4) Please power again after successful calibration.

Attention :

- 1) Compass should be done after changing flying area.
- 2) Calibration should be done in outdoor, wild and far away from high tension line tower which is easy influenced by magnetic interference.
- 3) Keep horizontal and vertical during the slow calibration.
- 4) Clockwise is the only direction.

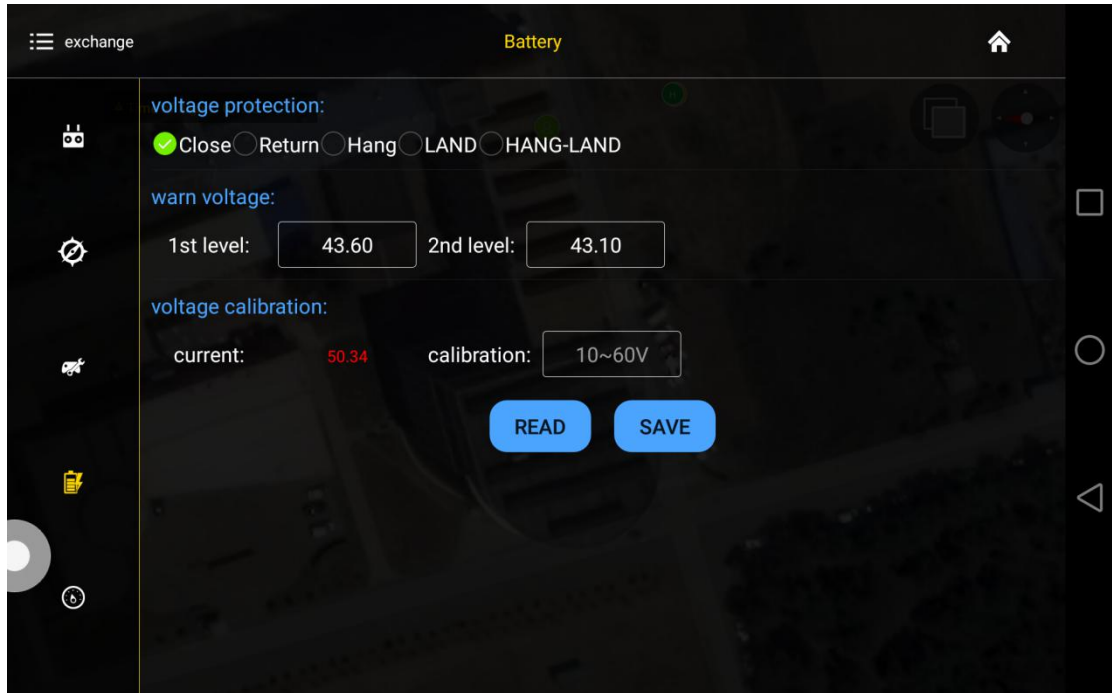

5.2.4 Flying parameters adjustment

Click the button *READ* to obtain the current flying parameters, click button *SAVE* to save the parameters.

The default number of back landing height is 20 meters, AB swath is 4 meters, route speed is 5m/s.

5.2.5 Low voltage protection

5.2.5.1 Low voltage protection settings

Five voltage protection has been provided: close, return to home point, hovering, auto landing, hovering and then landing. User could choose the one suitable. **The default is auto landing.**

5.2.5.2 Alarm voltage settings

Settings of first alarm and second alarm. It's recommended to 43.6V for the first alarm and 43.1V for second alarm.

LED will flash yellow triple when get to the first alarm level; LED will flash rapidly when get to the second alarm level, copter will react as the low voltage settings, such as return to home or landing.

5.2.5.3 Voltage calibration settings

Flight controller voltage sensor need to be calibrated if flight controller voltage sensor result is different from real voltage. Real battery voltage should be filled in measured voltage, flight controller voltage will be calibrated by clicking save. **It's unnecessary to set by user as calibration has been done before delivery.**

5.2.5.4 Pump and liquid level sensor settings

The screenshot displays the 'PUMP AND LIQ' configuration interface. The top bar indicates 'exchange' and 'PUMP AND LIQ'. The main section is titled 'LIQ' and shows 'Current Liq Percent' at 0%. Under 'protect:', there are four radio button options: 'Close', 'Return', 'Hang' (which is selected with a green dot), and 'HANG-LAND'. The 'warn:' section contains two input fields: 'warn 1st' set to 60.00 and 'warn 2nd' set to 20.00. The 'Spraying Settings' section includes 'spraying(Max)' set to 6.00 and 'spraying(Min)' set to 0.20. At the bottom, there are two blue buttons labeled 'READ' and 'SAVE'.

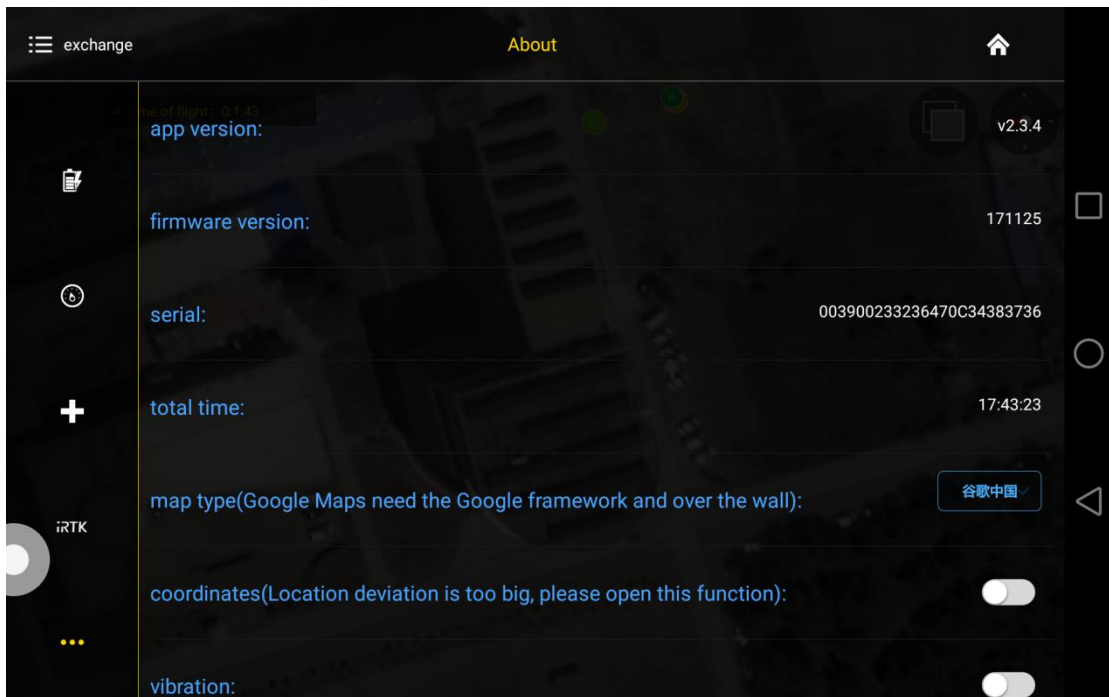

5.2.5.5 Tank empty reaction

The following reaction could be set: close the pump, return to home point, hovering, hovering and then landing. The default is close the pump, which means only LED flash as alarm.

Spraying settings

Combination control of the pump, max flow rate match to max flying speed. The maximum default combination number is 6m/s, minimum default combination number is 0.2m/s.

5.2.6 About interface

Open about interface,choose **map type**,choose **Google map**.Voice alarm could be opened.

5.3 Route establish

Make point by map,make point by drone,make point by dot equipment,make point by phone.Working area could be done by the followings:

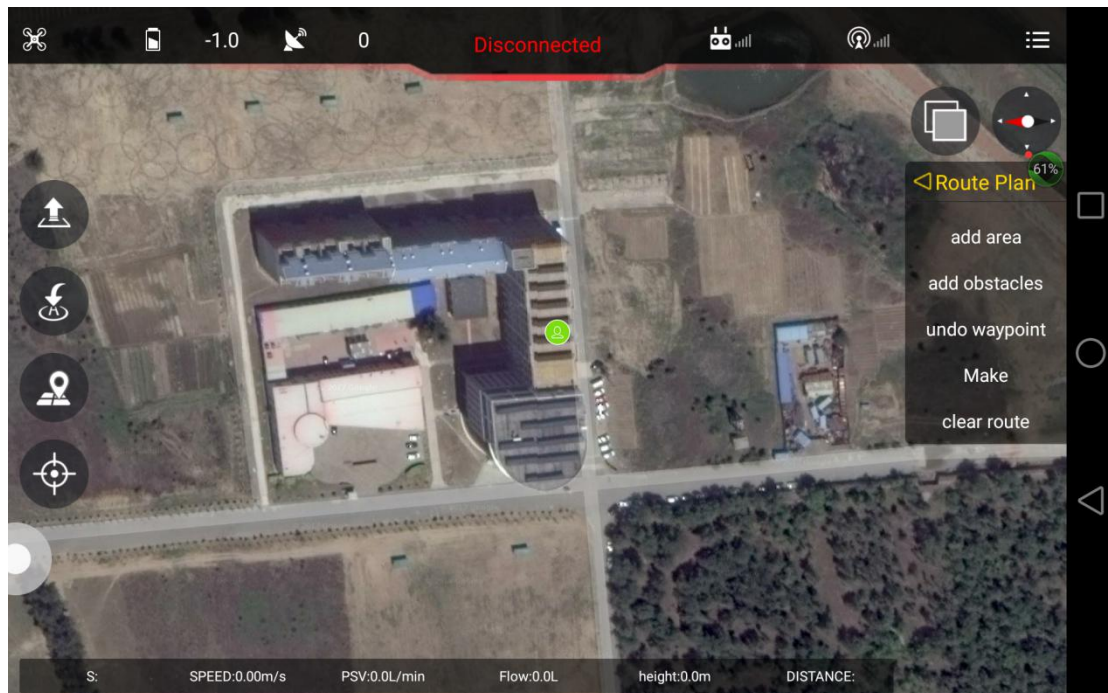

1. Click  to enter into route interface.

2. Click *new* to select point making type.

Making point from map(map point)

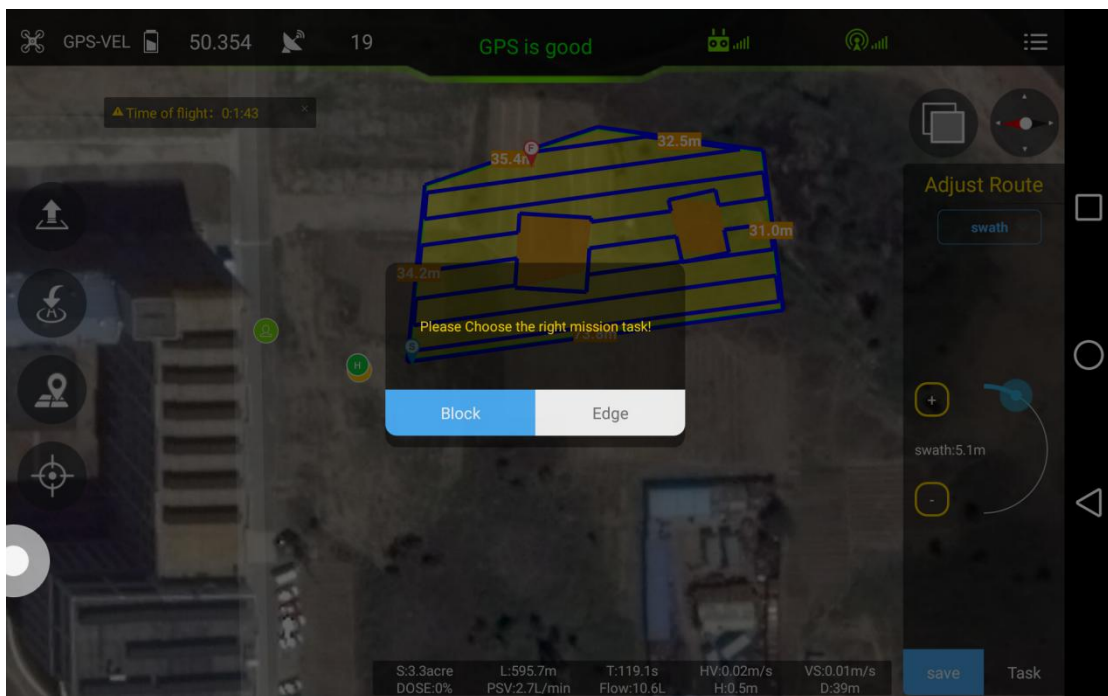

Select *adding area* to choose working area, obstacles could be added by clicking *add obstacles*.

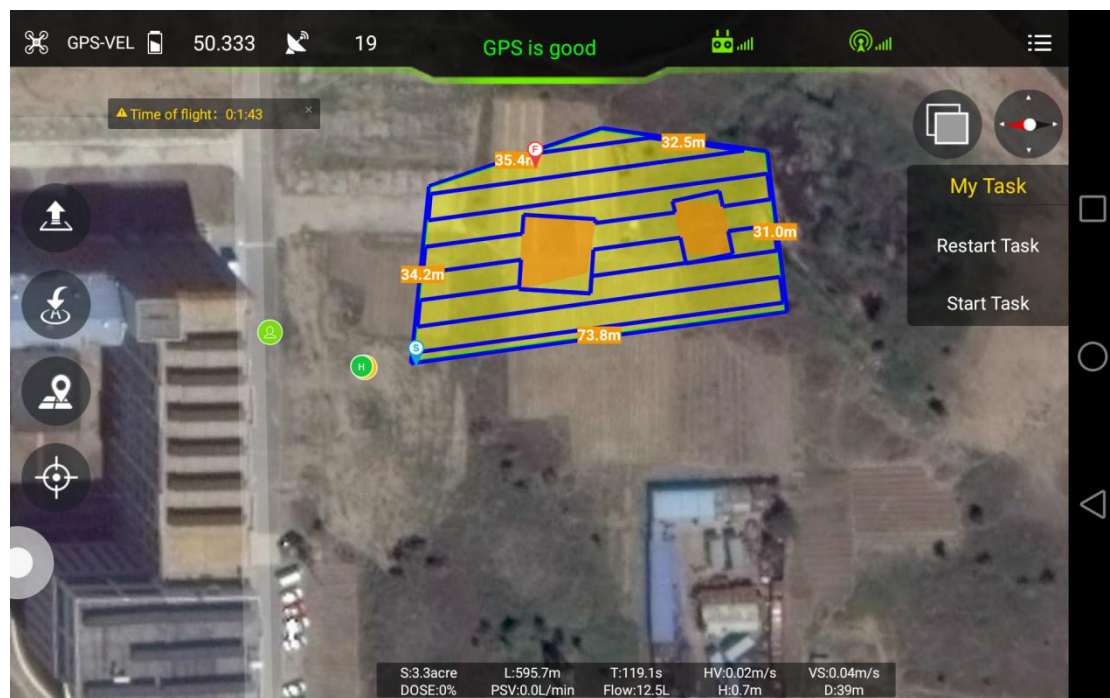

Route can be made after area added.

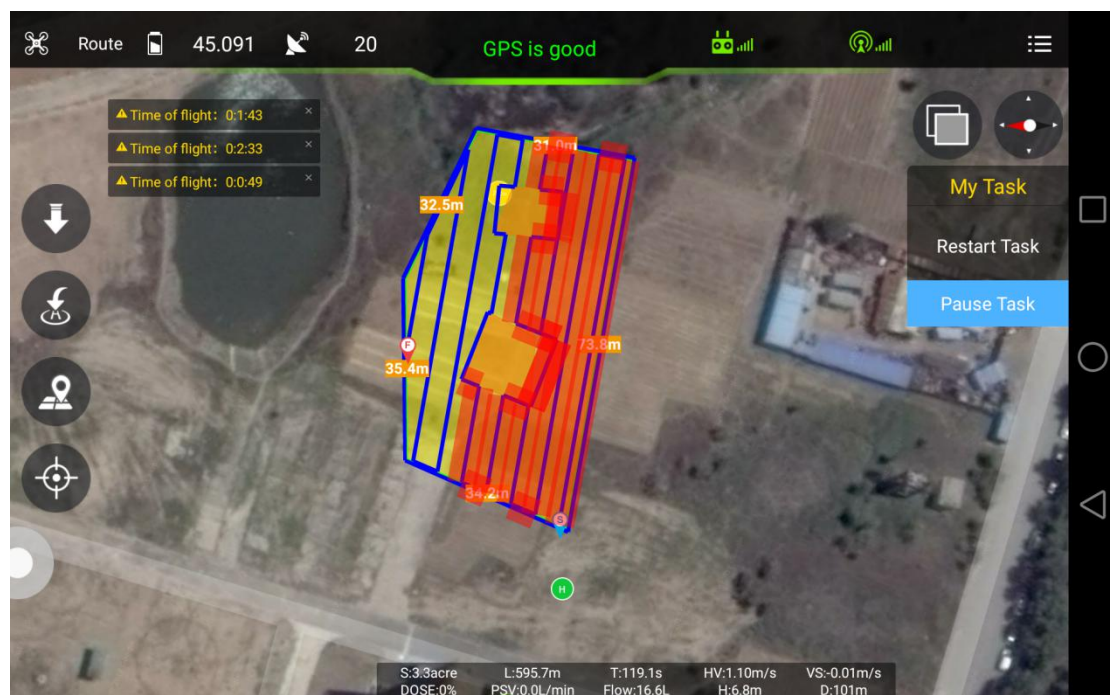

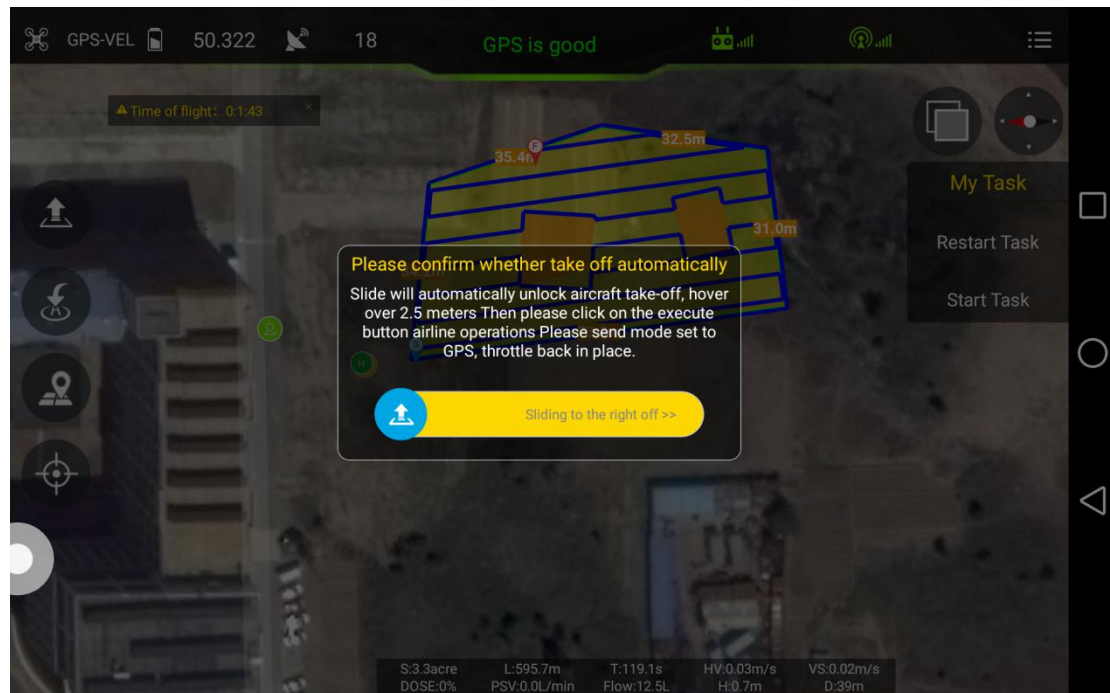

Swath(distance between each spraying),*angle*(angle of line),*obstacle gap*(distance around the obstacle),*target gap*(distance between working area and boundary),*offset*(offset of working area) in *Adjust Route interface*. Task could be saved according to demands, and then upload it by selecting block(working area).

Click  to take off from GCS or remote controller, click *start task* to execute the route.

Rudder and **Throttle** could be changed during flying, obstacles could also be avoided by moving the **Aileron** stick.

6. Remote Controller

- ◆ Charger output more than 5V should not be used.
- ◆ Remote controller charging current should be not more than 2A.
- ◆ Any damaged,smoking or abnormal heating charger should not be used.
- ◆ Charging should not be continued in condition of smoking,smelly,weeping.
- ◆ Charging should not be in the area of baby playing.
- ◆ Charging should not at temperature more than 60°C.

6.1 Function description

Channel	top	middle	bottom
SA: flight mode	Altitude mode	GPS mode	AB mode/automatic
SB: pump mode	OFF	combination	manual
SC: terrain following	OFF	/	ON
SD: AB recording	/	Recording Point A	Recording Point B
S3: pump	OFF	/	ON
S2: back landing	OFF	/	ON

6.2 Bind

Bind by receiver

◆ Select *setting* of main menu,click *system setting--Comm Set*,click Bind *start*,then *bind* will be displayed.Power on the control system by power bank,copter will enter into bind mode automatically if the last remote controller signal could not be inspected after 5 seconds,*finish* will be displayed. **Remote controller need to be calibrated after bind.**

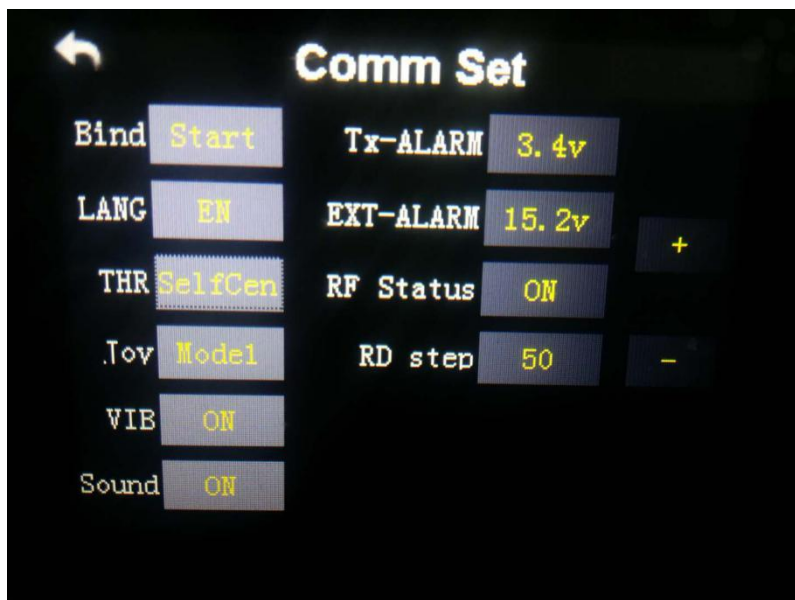

Bind by datalink

◆ Select *setting* of remote controller,click *datalink--Basic Set*,click Bind Start,power on the control system by power bank,datalink will enter into bind mode automatically if last remote controller can not be inspected after 5 seconds,*finish* will be displayed.

◆ Remote controller joystick setting

1. Sel back to center remote controller:close alarm function.
2. Remote controller need to be set. Setting method:main menu--*system setting*--click THR,choose SelCen.

Language could be set.

6.3 Remote controller antenna direction

Remote controller antenna should straight up when normal operation.

6.4 How to change between mode 1 and mode 2

Please change in the position: System--Comm Setting--Joy

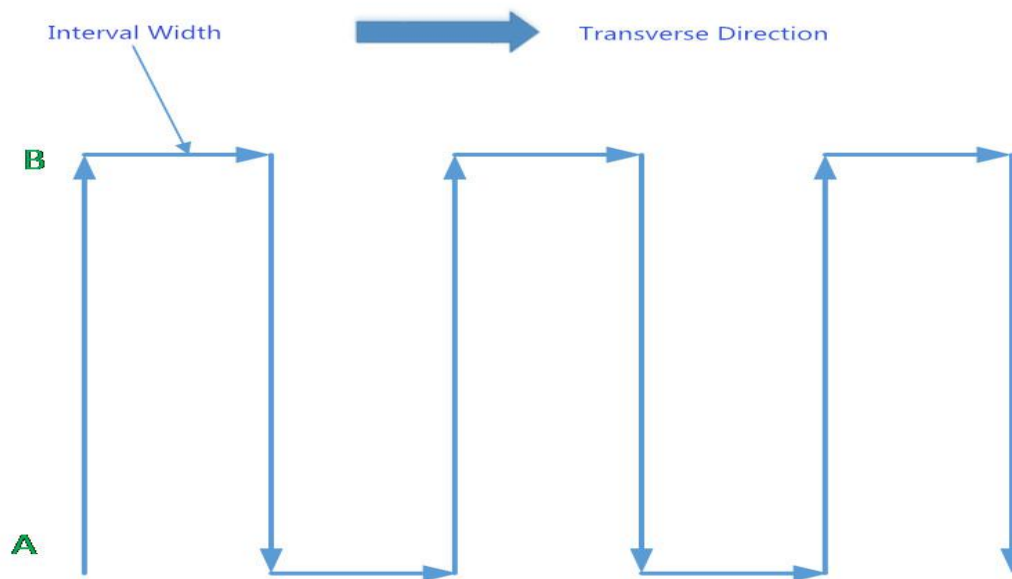

7. Function Control

7.1 Flight Mode

Flight mode	Instruction	Operate	Condition
Altitude mode	Horizontal stabilization, yaw locked, fixed altitude	By transmitter	GPS satellite enough, LED does not flash red
GPS mode	Fixed horizontal point, yaw locked, fixed altitude	Transmitter operation/empty tank reaction/others	GPS satellites enough, LED does not flash red
AB mode	Copter will fly and spray along with AB point	Record point A and B and switch to AB mode, choose left or right for roll	GPS satellites enough, LED does not flash red

Return mode	Copter will fly back home point automatically, flying back tail to home point and then descend slowly, it could be controlled after arriving on the top of home point except throttle	Press button Home continuously/empty tank reaction/low voltage reaction/reaction of losing transmitter signal	GPS satellites enough, LED does not flash red
-------------	---	---	---

7.2 AB Mode

AB mode is a more simple efficient mode with fault tolerance to operate. The working theory is above in the picture. Record the point A and B, the UAV will plan the flight line like this.

1. Operate Steps:

- 1) Record the point A, switch the mode to GPS mode. Until the drone self-hovering steadily, switch SD to "Point A memorized". After that, the LED flash yellow for 2 seconds. The controller have voice prompt.
- 2) Record the point B, drive the drone to the position you want, **be sure it is at least 10 meters away from point A**. Until the drone self-hovering steadily, switch SD to "Point B memorized". After that, the LED flash yellow for 2 seconds. The controller have voice prompt.
- 3) Select the direction, switch SA (Flight mode) to AB mode, move the roll joystick to select the roll direction. Move the joystick to the left limitation, the drone rolls to the left side, move the joystick to the right limitation, the drone rolls to the right side. While the drone doing AB point flight mode, the user can stop controlling the joystick. **Make sure that the water enough, the pump is under auto-controlled or manual-controlled.**
- 4) AB Mode Correction
 - ① Altitude correction: Control the flight altitude by the throttle joystick, "up" for the drone to rise, the "down" for the drone to set ;
 - ② Correct the the rudder to control the direction;
 - ③ Fix point A: while the drone moving from point B to Point A, push up the pitch stick to make point A 1m closer to point B, push down the pitch stick to make point A 1m away from point B.
 - ④ Fix point B: while the drone moving from point A to Point B, push down the pitch stick to make the point B away from point A, push down the pitch stick to make point B 1m closer to point A.
- 5) Shut Down and Quit
 - ① When set the "no pesticide" action to self-hovering or return, in AB mode this function still

works.

②When set the “low battery” action to return,in AB mode the this function still works.

③After the spraying work is done,AB mode can be shut down by switching into altitude mode.

6) To return to the breakpoint, shut down the AB mode auto-controlled or manual-controlled. After filling the pesticide in the tank and taking off,switch SA (flight mode)to AB mode directly ,the drone would return right to the breakpoint.

2. Remove Point A and B

Move stick SD (AB mode) for 4-5 times rapidly,LED alternately flash red green and yellow,AB mode removed.**Without removing last AB point,can not set new AB point.**

3. Set the Interval Width

From the software->Flight parameters to set the spraying width and working speed

Attention:

- 1) Be sure to start AB mode within turning on the pump and agitation function working.
- 2) Be sure it is at least 10 meters away from point A to point be.
- 3) Every time recording point A and B,be sure to wait until the drone self-hovering steadily in GPS mode.
- 4) Without removing last AB point,can not set new AB point.

Appendix I Implication of Indicator Light

Items	Indicator light	Priority
Flying Mode		
Gyro mode(stabilization,altitude)	Green light single flash●	Low
GPS mode (angle,speed)	Green light double flash●●	Low
AB mode	Green light triple flash●●●	Low
GPS		
GPS unconnected/GPS receive no satellite	Red light triple flash●●●	Low
GPS bad signal	Red light double flash●●	Low

IMU over vibration/error	Red and yellow light alternating flash●●●●●	High
Other Situations		
Initializtion of power on	Red,green and yellow light alternating flash●●●	High
Unlock	Red,green and yellow light alternating flash●●●	High
Unlock failed	Red light constant light●——	High

Appendix II How to connect copter to PC GCS

1 Unscrew the 8 pieces of bolt and open the upper cover,see figure 1:

2 Find the computer connection cable from the attached bag,see figure 2:

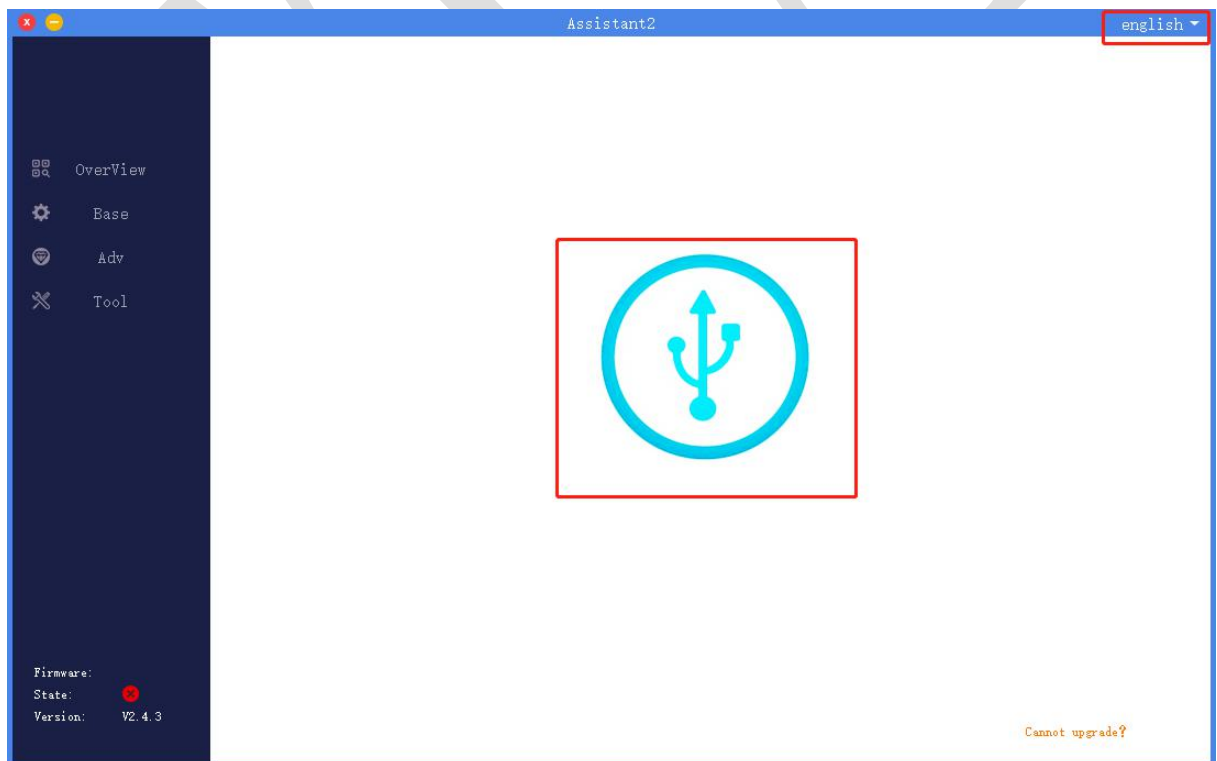

3 One connect to computer,another end connect to copter.Waiting for a moment(It takes few minutes to install the driver for the first connection with a new computer),see figure 3:

Appendix II How to connect copter to PC GCS

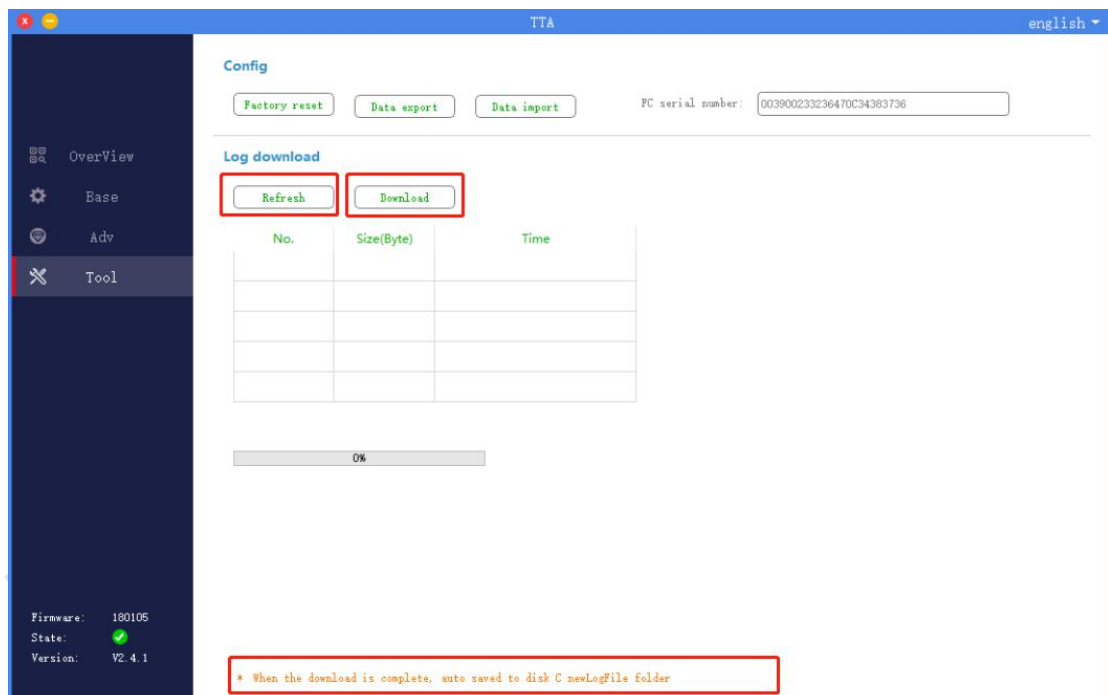

4 Open PC GCS,select the language you need.Click the connection button,see figure 4:

Appendix III How to download log from PC GCS

1. Open the PC GCS, select Tool menu
2. Click Refresh button
3. Click Download button
4. Log is saved in the position as the orange word

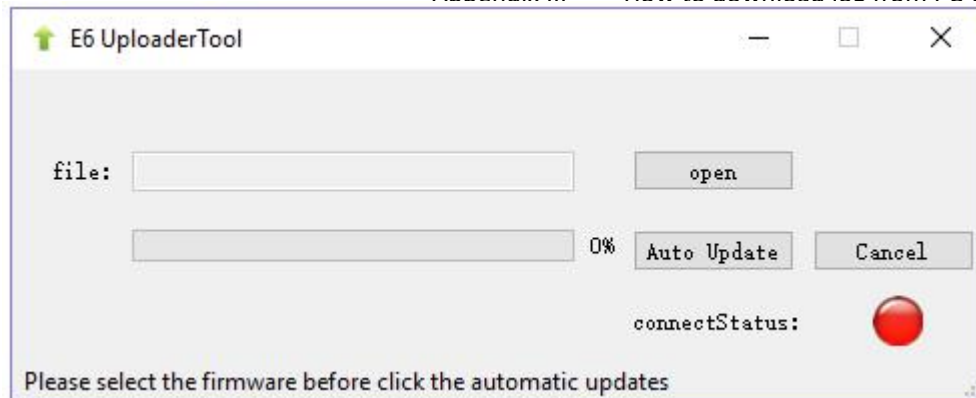

Appendix IV How to upgrade the firmware

- 1 download the upgrading tool from the following address:

<https://www.dropbox.com/sh/371k17zp8guv5y9/AAB8fUGjJ7zCN8qRF0Do8x57a?dl=0>

- 2 Open the upgrading tool, see the following picture:

- 3 Click the button *open*, select the correct firmware.
- 4 Click the button *Auto Update*, then the circular indicator will turn to be green. LED of copter usually is OFF during upgrading.
- 5 Waiting until the down left corner to 100%. The circular indicator will also turn to red and LED will flash red yellow green to self inspection. Waiting for a moment, the led will flash normally, then upgrading is finished.
- 6 Close the upgrading tool and disconnect the upgrade cable.
